

Michael Alusa Limisi

Applied AI Engineer | Agentic Systems, Workflow Automation & Support Operations

Nairobi, Kenya · michaellimisi7@gmail.com · [LinkedIn](#) · [GitHub](#) · [My Portfolio](#)

PROFESSIONAL SUMMARY

Applied AI Engineer with 8+ years of experience building production-grade agentic systems, AI-powered automation pipelines, and intelligent knowledge infrastructure. I got into this field through the support side of engineering, which means I've spent years sitting at the intersection of broken APIs, frustrated users, and complex systems, and learning to build my way out of the problem rather than just document it. Today, I design and ship multi-agent workflows, MCP-integrated tooling, and LLM-powered operations systems that measurably reduce manual work and surface institutional knowledge at scale. I'm most valuable in environments where someone needs to figure out what to automate, build it quickly, and make it actually stick with the teams using it.

SKILLS & TOOLS

AI & Agents	LLM orchestration, Agentic systems, Multi-agent pipelines, Model Context Protocol (MCP), Prompt engineering, RAG pipelines, Claude / Claude Code, OpenAI API, LangChain (learning), LangGraph (learning), Anthropic tooling, ChatGPT, Gemini
Automation	Make.com (advanced, certified), Workflow automation, AI-assisted workflow design, API integrations, Webhook architecture
Engineering	Python, JavaScript, REST APIs, PostgreSQL, SQL, Git / GitHub, Postman, AWS CloudWatch, Log analysis
Ops & Systems	Support systems design, Knowledge base architecture, Root cause analysis, SLA management, Process optimisation, Technical documentation
Tooling	Notion, Zendesk, Intercom, Jira, Stripe billing, AWS CloudWatch

SELECTED AI PROJECTS

Multi-Agent Prospect Intelligence Platform

- Built a fully autonomous, multi-agent platform that researches prospects across Reddit, LinkedIn, company websites, and job postings — identifying pain points, evaluating urgency, generating personalised outreach, and updating CRM systems, with daily executive summaries produced without human input.
- Stack: Python, LLM orchestration, MCP-compatible tool integrations, structured memory systems, Make.com workflow automation.

AI-Powered Incident Documentation Pipeline

- Designed and shipped a pipeline that converts raw engineering chat logs (Slack/Notion) into structured knowledge base entries — covering root cause, resolution steps, and tags — using a Make.com MCP integration and Claude. Handled PostgreSQL deadlocks, JWT/JWKS auth failures, and rate-limiting incidents across production.
- Eliminated ~3 hours/week of manual post-incident documentation; knowledge entries are now referenced in future debugging within the same sprint.

Support Intelligence Engine

- Built an internal system that transforms unstructured customer requests into structured diagnostic workflows, root-cause hypotheses, and ranked resolution paths — cutting median first-response investigation time by roughly 40%.

AI-Assisted Support Engineering Training System

- Designed a simulation environment replicating live support queues, issue reproduction, and escalation workflows — used to onboard new engineers 2–3x faster than the previous shadowing approach.

AI Knowledge Builder

- Automated the conversion of unstructured support conversations into reusable, searchable operational knowledge in Notion — reducing documentation effort by ~60% and enabling knowledge reuse across teams.

WORK EXPERIENCE

Technical Support & AI Automation Engineer — Arucy Enterprises

Nairobi, Kenya, June 2024 – Present

- Independently conceived, designed, and shipped an AI-powered ticket triage and knowledge extraction system — using LLMs, APIs, Make.com, and MCP-based architectures — that reduced manual investigation effort significantly and enabled the support organisation to scale 5× without proportional headcount growth.
- Designed and deployed multi-agent AI workflows that transform unstructured operational data (chat logs, support tickets, incident reports) into structured, searchable knowledge — directly reducing time spent on recurring investigations.
- Proactively identified recurring API, webhook, and integration failure patterns before customer escalation using AWS CloudWatch and log analysis, preventing roughly 30% of ticket volume from ever reaching the queue.
- Served as the primary technical liaison between Support, Engineering, and Operations — translating complex system failures into clear business-impact summaries and driving cross-functional resolution for the company's 1M+ user platform.
- Managed complex Stripe billing disputes and customer escalations while maintaining 95% CSAT and full SLA compliance across all severity tiers.
- Created automation tooling, SOPs, and Notion-based knowledge systems that became the operational backbone of the support team.

Software Developer — iTalanta

Nairobi, Kenya, Oct 2023 – Apr 2024

- Optimised database queries and application logic, improving API response times by 30% and improving platform stability across a customer-facing product.
- Worked directly with APIs, databases, and application logs to diagnose production defects and validate fixes — building an intuition for system behaviour that now underpins my automation and AI diagnostic work.
- Created troubleshooting documentation and internal guides that reduced median resolution time for recurring issues and improved self-service adoption.
- Supported customer onboarding and migration initiatives, implementing monitoring and validation processes that minimised downtime during transitions.

Senior Consultant & Client Project Lead — CustomMade

Massachusetts, USA (Remote) June 2018 – Aug 2023

- Managed high-value, technically complex client projects end-to-end — translating ambiguous requirements into detailed specifications, coordinating across design, production, and ops teams, and maintaining high customer satisfaction across a high-volume portfolio.
- Developed documentation and process improvements that streamlined communication between customers and internal teams, cutting delivery rework noticeably.

EDUCATION & CERTIFICATIONS

B.Eng. Electrical Engineering & Electronics · NIT Warangal India 2012 – 2016

Certificate in Software Development · Moringa School, Nairobi Feb – Nov 2023

Make.com Certification · Make.com Online 2024

Currently completing: LangChain & LangGraph for Agentic AI (in active use in production projects)
